Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1857 Excerpt: .Secondly, the upper portion, which is exposed to pressure, is in the position of a column, and consequently more likely to give way by bending laterally than by being merely crushed. Owing to the increase of thickness and breadth hence requisite in the part exposed to pressure, it is unadvisable in practice that the ratio of the amount of pressure to that of tension exceed 2 to 1. Although it is, therefore, inexpedient to give this form of section, we may obtain an approximation to it as regards the bottom flange, as in Fig. 25, by making the rise of the step on the bottom flange equal to about  $\frac{1}{4}$  or of an inch. For railway girders of cast-iron the weight usually calculated for is 2 tons per foot of span for each girder, and more when the span is above 40 feet, and this material is used; which, however, is not expedient, nor necessary. For the cast-iron girders of roadways take from 7 to 75 tons per square yard of roadway, which weight may be distributed over 5, 6, or 7 girders, as the case may be, including the outside girders. It has already been pointed out that depth is an important element in a girder. Depth in a beam increases its rigidity, but lessens the elasticity. It is also to be observed that depth increases the height of the column of which we have spoken above, and with the increase of height the liability to...
